

## WATERING A NEW PLANT

How much water? Most new plants should be given about an inch of water every time that they are watered. Set out a container and measure how much is collected when you irrigate. Adjust time of irrigation as needed.

How often do I water? The frequency of watering will depend on temperature, rainfall and the type of soil you have. Sometimes it's just a judgment call. If you have clay soil, it will hold water longer. If you have sandy soil, you will need to water more often. It will help if you amend the soil properly when you plant.

### Temperature rule of thumb:

If Temperature Highs are in the :	You should water:
50's or lower	Only if temps rise above this for a few days or if we lack rain for a couple of weeks.
60's	Once a week or once every five days. If it rains, just skip watering for five days.
70's	Every three days
80's	Every other day
90's	Every day
100's	Perhaps twice a day, especially if you observe wilting foliage
